

IN THE CLAIMS

Please cancel claims 1-25, all of the claims in the subject U.S. patent application, as filed, as constituted by the verified translation of PCT/DE2003/003643. Please also cancel replacement claims 6-10, submitted under Article 19 and as set forth in a letter from KBA to the International Bureau on August 5, 2004. Please add new claims 26-49, as follows.

Claims 1-25 (Cancelled)

26. (New) A printing press comprising:

at least one forme cylinder;

at least one inking unit selectively positionable in a first inking unit position adjacent said forme cylinder and a second inking unit position remote from said forme cylinder;

at least one printing forme changing device selectively positionable in a first printing plate changing device position remote from said forme cylinder and a second printing plate changing device position adjacent said forme cylinder; and

means coupling said at least one inking unit and said at least one printing forme changing device wherein a movement of one of said inking unit and said printing forme changing device between its respective first and second positions.

27. (New) The printing press of claim 26 wherein said at least one inking unit and said at least one printing forme changing device are fixedly connected with each other.

28. (New) The printing press of claim 26 wherein said at least one inking unit and said at least one printing forme changing device are driven by a common drive mechanism.

29. (New) The printing press of claim 26 further including a stationary printing press element supporting said at least one forme cylinder, and a movable printing press element supporting said at least one inking unit.

30. (New) The printing press of claim 29 wherein said at least one printing forme changing device is attached to said movable printing press element.

31. (New) The printing press of claim 29 further including a drive mechanism for moving said movable printing press element and said printing forme changing device.

32. (New) The printing press of claim 29 further including a forced guidance device provided between said movable printing press element and said printing forme changing device, said forced guidance coupling said movable printing press element and said printing forme changing device.

33. (New) The printing press of claim 32 wherein said forced guidance device includes at least one push rod and a pair of guide rollers defining a gap, said pair of guide rollers being fixed with respect to said printing press, said at least one push rod being guided for movement in said gap.

34. (New) The printing press of claim 29 further including a first drive mechanism for said movable printing press element and a second drive mechanism for said printing forme changing device and further including a common control device for said first and second drive mechanism, said common control device controlling said first and second drive mechanisms for controlling movement of said printing forme changing device as a function of movement of said movable printing press element whereby said printing forme changing device and said movable printing press element movements are matched to each other.

35. (New) The printing press of claim 26 wherein when said printing forme changing device is in said first printing forme changing device position, said inking unit is in said first inking unit position.

36. (New) The printing press of claim 26 wherein when said printing forme changing device is in said second printing forme changing device position, said inking unit is in said second inking unit position.

37. (New) The printing press of claim 29 further including a plurality of said forme cylinders in said stationary printing press element and a corresponding plurality of said inking units in said movable printing press element.

38. (New) The printing press of claim 37 wherein said plurality of said inking units are supported in said movable printing press element for movement with respect to said plurality of associated forme cylinders concurrently.

39. (New) The printing press of claim 37 wherein said plurality of inking units in said movable printing press element are seated in a common frame.

40. (New) The printing press of claim 26 further including a transfer cylinder and a plurality of said forme cylinders arranged around said transfer cylinder in satellite construction.

41. (New) The printing press of claim 26 further including a driven side of said printing press, said at least one printing forme changing device being located at said driven side of said printing press.

42. (New) The printing press of claim 29 further including a plurality of said printing forme changing devices in operational contact with said movable printing press element.

43. (New) The printing press of claim 42 wherein all of said printing forme changing devices are parallel to each other.

44. (New) The printing press of claim 42 wherein all of said printing forme changing devices are arranged in a star shape with respect to said stationary printing press element.

45. (New) The printing press of claim 42 further including a plurality of printing formes in said stationary element and wherein said plurality of printing forme changing

devices act together with said plurality of forme cylinders.

46. (New) The printing press of claim 29 wherein said movable printing press element moves in one of a radial and an axial direction with respect to said stationary printing press element.

47. (New) The printing press of claim 29 wherein said movable printing press element movement is linear.

48. (New) The printing press of claim 26 wherein said at least one printing forme changing device moves in an axial direction of said forme cylinder.

49. (New) The printing press of claim 49 further including at least one guide element, said at least one printing forme changing device being fastened on said at least one guide element.
